

Securing your Digital Transformation

Driving Digital Business Securely

The only effective approach to security is a holistic, architectural approach – one that is manageable, adaptable, resilient and responsive.

Your digital business happens at the edge – customer endpoints, cloud and IoT.

This creates new demands on your network, increases your attack surface and opens new ways to attack.

Defend at the Edge?

That just doesn't fly anymore. A traditional perimeter firewall just won't cut it.

Threat centric view

The threat landscape has changed – have an approach to security that is threat-centric.

Next Generation Security

The new approach is holistic. It's about a complete security architecture, where all the pieces work together.

Endpoint Protection

And don't forget to secure all those endpoints – mobiles phones running web apps & email, all those sensors for your IoT.

The Network as a Sensor

Then you need a network that acts as one big security sensor. It's the perfect spot – it sees everything!

Next Generation Firewalls

Detect early - protect quicker! Fast, intelligent and software defined, next generation firewalls are the first step.

Securing the Virtual World

VMs/containers, on prem/cloud – with virtual firewalls and micro-segmentation, keep your virtual world as safe as the physical one.

Contextual Awareness

Security for 'who' is great. Security for who, when, where and what device is essential and awesome!

Cloud Intelligence

When you plug into the cloud, security intelligence becomes pervasive. You get realtime updates that your security architecture can automatically act on, no matter where the attacker tests you.

Security Services

Logicalis' Managed Security Service helps organisations respond to alerts effectively by monitoring threat activity and acting as a first responder to decide what's a real threat and what's not.

Unified Management

You then bring all this together under one management umbrella – better visibility, user friendly interface and graphics, as well as added simplicity.

A Security Framework

Frameworks mean best practise and industry standards. A policy driven security framework speeds up automation, reducing the all-important 'attacker free time'.

Pervasive - Integrated - Continuous - Secure

Choose Logicalis Security Practice because:

Security is in our DNA

It's baked into everything we do – how we think and most importantly how we act. We've been helping our customers solve their security issues for years!

We have a true understanding of analytics

How many other security companies are you working with that specialise in data analytics, business consulting and information insights?

We work together

At Logicalis it's all about forming a partnership. We want to become part of your extended team, we want to think like you and share in your security risks and concerns.
